Introduction

Welcome to the 17th Edition of the *Gun Digest Book of Modern Gun Values*. In this book you will find historical data, photographs, detailed descriptions, technical information, and estimated values of virtually every handgun, rifle, and shotgun of the modern smokeless-powder era, generally defined as those manufactured or imported into the United States since 1900. More than 8,500 firearms are profiled in these pages, including many newer models that the gun companies have introduced since the last edition was published in 2011. Estimated values have been revised for more than 1,500 models or variations, most on the upside and a few downward, as the popularity and demand for certain models have changed. Economic conditions seem to have improved somewhat since the last edition went to press, which has pushed up values, especially for higher-priced collectable models.

Modern Gun Values profiles the products of all major U.S. gun manufacturers and importers and, in most cases, every model variation that appeared in the company's catalogs. Not every prototype or projected new introduction is included, such as the occasional model that was shown at trade

shows, but, for whatever reason, never went into production. Still, for their historical value, some prototypes or models with very limited runs are listed.

This book is primarily designed for the gun owner or potential buyer who wants a handy source for the estimated values and descriptions of the models likely to be seen in gun stores, at gun shows, or auction sites. Some military-issue weapons are included but, for the most part, *Modern Gun Values* focuses on firearms produced for the general civilian market. We also limit listings for made-to-order custom firearms, especially those produced by one- or two-man shops that turn out only a handful of guns each year. For those interested in a wider range of firearms or a more in-depth look at specific categories, we call the reader's attention to these other Krause publications: *Standard Catalog of Firearms*, *Flayderman's Guide to Antique American Firearms*, *Standard Catalog of Military Firearms*, and *Gun Digest Buyer's Guide to Tactical Rifles*. The company also publishes books that focus exclusively on the firearms of a specific manufacturer, such as *Standard Catalog of Colt Firearms*, *Standard Catalog of Browning Firearms*, and similar titles covering the guns of Winchester, Smith & Wesson, and others.

THE TACTICAL BOOM

Since the previous edition of this book went to press, the subject of firearms has been almost continuously in the news, and much of the media attention has had an effect on both supply and demand. During a contentious general election campaign in 2012 that lasted way too long, there were fears among many gun owners that a continuation of the Obama administration would bring about new gun legislation. Well before the election was over, many were very worried about what the future held and rushed to gun stores and shows in response to the “get ‘em while you can” warnings from sellers. The results were no surprise: shortages in certain models, mostly high-capacity semi-auto rifles and pistols. Notable mass shootings in 2011 and 2012 kept guns in the headlines and brought even more calls for stronger gun controls, which again pushed up the demand for AR-15 type models. Prices at the retail level began to exceed MSRP, and manufacturers increased their production to keep up with the demand. When President Obama was re-elected, that demand increased exponentially.

In December 2012, the massacre at an elementary school in New Town, Connecticut, shocked the nation, and restrictive legislation on military-style firearms was quickly passed in several states. Gun control advocates renewed their efforts for more federal gun laws through Congress. All this occurred in spite of the fact that most experts—including

those on the anti-gun side—admitted that the laws being passed would not have prevented the New Town shootings.

For several months, prices for military-style rifles went even higher, and ammunition for all types of guns began to disappear from gun store shelves. Hoarding, whether for fear of continuing shortages, or greed from speculators looking for reselling opportunities, continued into the spring of 2013. Then, by mid-summer, the tactical gun price bubble began to deflate. Production had caught up with demand, as the now more than 100 AR-type manufacturers, large and small, began to catch up with their orders. One could again buy a new AR-style rifle for the manufacturer's suggested retail price and, in some instances, below MSRP. Ammo shortages began to end for the same reasons, though there are still limits on purchases in many areas, especially for .22 rimfire.

The initial plans for this book included expectations for higher values for new or used tactical-style rifles, especially AR-15 types, but that turned out not to be the case. Some models are more popular (and pricier) than others, but, as we go to press, the shelves of gun stores across the country have, for the most part, returned to normal. Of course, no one can predict what the future holds for the values of firearms, gold, art, or any other investment or collectible. Or stocks or real estate. But, for those of us who just happened to love the look and feel of a fine firearm, we like the fact that

such a purchase might turn out to be a good investment, and, if it doesn't, well, you just can't have too many guns.

HOW TO USE THIS EDITION

Modern Gun Values is divided into four major sections – Handguns, Rifles, Shotguns and Commemoratives. Within each of these sections the individual firearms entries are listed in numerical model, then alphabetical, order. (A valuable reference section is also included in the back pages of this book.)

Readers can locate a particular gun in three ways: by browsing through the sections and alphabetical manufacturers' listings; by consulting the comprehensive "GUNDEX" index section; or by consulting the "Manufacturers' Directory" that precedes each respective section of the book. We have attempted to improve the illustrations shown in this book wherever possible and especially in those cases in which illustrations help the reader to differentiate between similar models.

We have established a three-tiered pricing approach for each firearm based on the six NRA Modern Condition Pricing Standards: New, Perfect, Excellent, Very Good, Good and Fair. Each firearm has been evaluated to determine which three NRA standards most accurately reflect the condition in which the particular firearm is most likely to be found on the used market; the firearm is priced accordingly. For example,

firearms currently on the retail market, or manufactured in the last four years, will most always be found in New or Perfect condition on the used market, while most older firearms will rarely be found in any condition exceeding Very Good. The three pricing levels we provide reflect current observations of prices seen at gun shows, in the gun shops or in the various periodicals, dealer's catalogs or at auction sales.

There are three primary factors that are key to establishing a firearm's value. These are demand, availability and condition.

DEMAND AND AVAILABILITY

One of the factors driving demand – and thus the value of a particular firearm – is availability. When demand exceeds availability, the price of the firearm increases. This pertains not only to collectibles but to shooting guns as well. For example, it is not unusual for a current-production firearm in limited supply to sell in the marketplace for prices considerably above the manufacturer's suggested list price. Even some Colt and Smith & Wesson models have enjoyed such run-ups. However, realize that in this case when supply finally catches up with demand prices will dip.

Some older firearms may be in scarce supply yet are not in demand by collectors. Without demand, regardless of availability, the dollar value of the firearm will be low.

CONDITION

Of the three factors used to establish value, condition is perhaps the most important and certainly the factor most frequently used by shooters as well as collectors for determining the price of a firearm. A “like new” example of a relatively common older Colt, Smith & Wesson, Luger or other arm popular with collectors can bring up to twice the price of another that easily ranks as “Excellent.” On the other end of the scale, a scarce, popular collectible in “Poor” or even “Fair” condition often will go begging at a fraction of its value in more acceptable shape.

Of course, neither condition nor pricing is ever absolute. There is no such thing as a fixed price. It’s an axiom among gun enthusiasts that there are only two conditions any two collectors can agree upon and those are “New” and “Junk”; everything in between is highly subjective and subject to debate. For example, a shooter looking at a potential acquisition might rate a gun with little finish but mechanically tight and with a fine bore, “Excellent”; to the collector that same firearm would rate only a “Good” or possibly “Very Good.” An old Luger with most of its original blue but with the bore badly pitted from corrosive ammunition would rate an “Excellent” from most collectors but only a “Fair” from a shooter. Collectors and shooters alike find the line between “Good” and “Very Good” or “Very Good” and “Excellent” a fuzzy one.

GUNS AND THE INTERNET

It is very important to educate one's self on the particular gun models that pique your interest, whether you're a buyer or seller. And if you want to build a serious collection, you need to become a true student of the gun. In addition to books like *Modern Gun Values*, the internet is a great source for information on firearms. Note in particular the auction houses that are listed below. Their websites provide not only a place to participate in the buying or selling of guns at their auctions, but also a way to track the asking and the selling prices of individual firearms.

The internet makes everyone a seller and everyone a buyer. It has infused an enormous volume of fresh blood into the hobby. In the past, a shooter or collector had to comb the classifieds, drive to every retail shop in the county, and attend gun shows to find a rare or scarce model. Nowadays virtually any gun can be found after a few minutes' searching online. The result? For newer guns, it's a buyer's market. For scarce vintage or antique models, it's a seller's market, at least as far as the internet is concerned.

At any rate, the effect of the internet on firearms pricing can neither be ignored nor overestimated. The worldwide web is the single greatest influence on modern gun values, and we can all use it to our advantage, either as buyers or sellers.

These are the most prominent auction houses that specialize in firearms and armory.

A REMINDER

Remember that the values shown here should be taken as guidelines, not absolutes. When a rarely seen gun that you've been wanting for a long time shows up at a price somewhat higher than we indicate, it still may be worth buying because the pleasure of ownership is often well worth the higher price. Many collectors freely admit they rarely regret the firearms they buy, but all too often regret the ones they didn't buy. On the other hand, don't be too quick to buy a common gun that you'd like to have when you see it at market price, since one will likely show up sooner or later at a lower price.

From the buyer's standpoint, pricing at the extreme ends of the condition scale (New to Poor) generally reflects the most you might consider paying for a particular firearm in a particular condition. From the seller's standpoint, these

values reflect ballpark figures where you might start your pricing, leaving yourself ample room for negotiation. In a bidding or other competitive situation, however, all bets are off. Whoever wants the item the most, and can reinforce his sentiments with his checkbook, will ultimately obtain it. The sky's the limit.

With any luck, however, the buyer's and the seller's comfort zones will overlap at a certain point, and that will be the figure for which the firearm is sold.

RESTORATION

For collectors in particular, there's another important aspect of condition that needs to be addressed and that is restoration. As the demand for many collectible arms has exceeded the supply of those in "acceptable" condition, many rare, and even not so rare, firearms have been restored. Pitted areas built up by welding, missing or damaged parts remade, obliterated markings re-rolled, grips and stocks with re-cut checkering, or the metal polished and refinished using the techniques of the original maker are some examples of the restoration work possible. A first-class restoration is an expensive proposition, but if properly done is often difficult to tell from original factory work.

But how does the value of a restored firearm compare with that of an original in like condition? A truly first-class job can bring close to the price of an original-condition example;

however, very few restorations are that good. Generally, a very good restoration is usually worth at best half as much as a nice original. Two warnings: First, beware of restorations passed off as original. Second, be extra aware of a common model that's "restored" into a rare variation by modifying markings, barrel length or the like. When in doubt, ask an expert and refer to the NRA's Code of Ethics. Misrepresentation can be fraud.

NRA CODE OF ETHICS

A listing of practices considered unethical and injurious to the best interests of the collecting fraternity.

1. The manufacture or sale of a spurious copy of a valuable firearm. This shall include the production of full-scale replicas of historic models and accessories, regardless of easily effaced modern markings, and it also shall include the rebuilding of any authentic weapon into a rarer and more valuable model. It shall not include the manufacture or sale of firearms or accessories which cannot be easily confused with the rare models of famous makers. Such items are: plastic or pottery products, miniatures, firearms of original design, or other examples of individual skill, plainly stamped with the maker's name and date, made up as examples of utility and craftsmanship, and not representative of the designs or models of any old-time arms maker.

2. The alteration of any marking or serial number, or the assembling and artificially aging of unrelated parts for the purpose of creating a more valuable or unique firearm with or without immediate intent to defraud. This shall not include the legitimate restoration or completion of missing parts with those of original type, provided that such completions or restorations are indicated to a prospective buyer.

3. The refinishing (bluing, browning, or plating) or engraving of any collector's weapons, unless the weapons may be clearly marked under the stocks or elsewhere to indicate the date and nature of the work, and provided the seller unequivocally shall describe such non-original treatment to a buyer.*

4. The direct or indirect efforts of a seller to attach a spurious historical association to a firearm in an effort to inflate its fair value; efforts to "plant" a firearm under circumstances which are designed to inflate the fair value.

5. The employment of unfair or shady practices in buying, selling, or trading at the expense of young and inexperienced collectors or anyone else; the devious use of false appraisals, collusion and other sharp practices for personal gain.

6. The use of inaccurate, misleading, or falsified representations in direct sales or in selling by sales list, catalog, periodical advertisement and other media; the failure to make prompt refunds, adjustments or other proper

restitution on all just claims which may arise from arms sales, direct or by mail.

*When the NRA formulated this Code of Ethics many years ago restoration was rarer than it is today and some restoration was indeed marked. However, such marking is rarely if ever done today and restoration is not only considered ethical but desirable when appropriate. Furthermore, for many, a restorer's mark in even the most inconspicuous internal location would detract from originality.

Fortunately, many knowledgeable collectors and dealers are able to distinguish even the best restoration work from "factory original." In addition, in the current marketplace it is not at all unusual for an owner or seller to not only admit restoration, but to state with pride that a certain arm was restored by a specific well-known restorer.

Ethically, of course, the fact that restoration work has been done and to what extent should always be disclosed to a prospective purchaser. Not to do so has, in the case of some very valuable collectibles, resulted in expensive and embarrassing legal actions.

NRA MODERN CONDITION STANDARDS

To give a firm foundation for the pricing structure of this edition, it is essential to establish a set of condition standards by which a firearm can be judged. We have adopted the well-respected and popular National Rifle Association's Modern

Condition Standards as a guideline to the various grades of condition but have made slight modifications (*italics*) to further help readers determine condition degrees.

New: In same condition as current factory production, with original box and accessories.

Perfect: In new condition in every respect, but may be lacking box and/or accessories.

Excellent: Near new condition, used but little, no noticeable marring of wood or metal, bluing perfect (except at muzzle or sharp edges).

Very Good: In perfect working condition, no appreciable wear on working surfaces, visible finish wear but no corrosion or pitting, only minor surface dents or scratches.

Good: In safe working condition, minor wear on working surfaces, no corrosion or pitting that will interfere with proper functioning.

Fair: In safe working condition, but well worn, perhaps requiring replacement of minor parts or adjustments, no rust, but may have corrosion pits which do not render article unsafe or inoperable.

The editors want to thank you for your interest in firearms, whether as a collector, hunter, competitive shooter, casual plinker, or simply one who is fascinated by the world of the gun. We especially thank you for your support of our corner of that world, the world of gun books!

—Jerry Lee and Richard A. Mann, Editors

Inspection Guide To Used Guns

by Patrick Sweeney

WHILE THE SATISFACTION of buying a new firearm, from the standpoint of warranty and features, appeals to many shooters and collectors, sometimes "used" is the only route. After all, how many new-in-the-box Winchester pre-64s still exist? Sometimes the only way to acquire the firearm model, or the firearm with the features you desire, is by buying it used. We all have budgets, and purchasing a used gun is much easier on them! Read on and learn how to buy "used" – safely.

If at all possible buy from an established dealer, with a track record and reputation. Even better, a dealer who has an in-house gunsmith who inspects all their used firearms and makes sure no lemons slip through. In the event one does, a reputable dealer will take it back or make it right.

What should the dealer warranty? The normal and expected performance and durability of that model firearm, and that he presented it correctly as to its features and performance. If you buy a plain old used 30-30 and find it shoots three- to four-inch groups at 100 yards, don't expect to be able to return it. If, however, it shoots those groups four feet to the left or right, you have every

right to return it. An as-new benchrest rifle better do well under an inch with its provided ammo, or you may have cause to return it (assuming you can shoot that well). If the dealer doesn't have a written warranty, ask what the return policy is.

If you are not buying from a dealer, you have the standard business-school Latin to guide you – Caveat Emptor: "Let the buyer beware." One approach that some of my customers took – and more should have – was to have their purchase inspected by a pro. If you have any doubts about an attractive purchase, take it to a gunsmith and explain things. Don't just drop it off for a "strip and clean" and count on him (or her) uncovering hidden problems.

Come right out and explain: You just bought it, and you want it inspected for safety, durability, function and headspace. If there is a limited return time, the gunsmith needs to know in order to inspect it within the allotted time. Many gunsmiths are booked solid for months and may not get it back to you in time if you leave your purchase for what the 'smith understands is just a "regular cleaning." By explaining your inspection period time constraint you can get your new purchase back in time to meet the refund terms of the sale, should you need to return the gun.

General Inspection of a Used Firearm

To start, give the firearm in question a quick visual inspection. I call it the "tire tracks and hammer marks" look, and it is the same regardless of the type you are thinking of buying. The inspection of

a firearm to determine the percentage of finish remaining is covered elsewhere. The purpose of this initial inspection is to uncover damage, repairs or abuse. Is the stock straight and clean? Is the barrel straight? Are the sights centered? Are there dents, scratches, cracks or repairs to be seen? Does the bluing have the right color? Are the barrel markings clean and crisp, or are they blurry or smeared? Is the barrel, the correct length? Is the muzzle uniform? Does the chambering marked on, the barrel match what the seller tells you it shoots? Try to get a "feel" for the history and typical condition of the gun you are looking at. Does it match the description of the one the seller is trying to sell you? A firearm that doesn't match what the seller describes is probably best left on the table.

Just because you are looking at a worn, used-to-gray rifle the seller describes as "the best he's seen" doesn't mean he's fibbing. If you are holding a Remington 700 in 308 Winchester – yes, he is. On the other hand, if you are holding a pre-'64 M-70 in 300 Savage – no, he isn't.

RIFLES

Open the action. With a light or reflector – and with the action open and bolt removed if appropriate – look down the bore. Clean, shiny and clear of obstructions, right? If not, let the bargaining begin!

While many rifles will shoot accurately with a slightly pitted bore, some won't – and all will require more frequent cleaning. Work the action and see if there are any binding spots or if the action is rough. Ask if you can dry fire it to check the safety.

Some people do not like to have any gun in their possession dry-fired; others don't care. If you cannot, you may have to pass on the deal. Or, you can assure the owner that you will restrain the cocking piece to keep the striker from falling.

Close the action and dry-fire it. How much is the trigger pull? Close the action, push the safety to *ON*, and pull the trigger. It should stay cocked. Let go of the trigger and push the safety *OFF*. It should stay cocked. Now, dry-fire it. Is the trigger pull different than it was before? If the pull is now lighter, the safety is not fully engaging the cocking piece, and you'll have to have someone work on it to make it safe. If the rifle fires at any time while manipulating the safety (even without your having touched the trigger) it is unsafe until a gunsmith repairs it.

A rifle fired with a poorly-fitted stock, or one dried out from decades of storage, will often crack light behind the tang. Look closely for cracks or repairs.

While you were checking the safety, just what was the trigger pull? A very light trigger pull is not always bad, but may need adjustment. As an example, if you are handling a Remington 700 or Winchester 70, and the trigger pull is one pound, someone may have adjusted the trigger mechanism. If you are handling a Winchester '94 and the trigger pull is a pound, someone has been stoning the hammer or sear. On the first two, you or your gunsmith can adjust the weight back to normal ranges. On the '94 you may have to buy a new hammer or sear – or both – to get the pull back into the normal range.

Are the screw slots clean, or are they chewed up? This screw is just tolerable. Any worse and it would indicate abuse instead of 59 years of indifferent attention.

Inspect the action and barrel channel. Is the gap between the barrel and the channel uniform? Or does the forearm bend right or left? Changes in humidity can warp a forearm and, if the wood touches the barrel, alter accuracy. The owner may be selling it because the accuracy has "*gone south*," and not know that some simple bedding work can cure it.

Look at the action where it meets the stock. Is the wood/metal edge clean and uniform? Or do you see traces of epoxy bedding compound? Epoxy could mean a bedding job, and it could mean a repair of a cracked stock. Closely inspect the wrist of the stock, right behind the tang. Look for cracks and repairs.

Check the edges of the stock where the action rests for signs of glass bedding. Bedding is not bad; in fact, it can be good. But don't pay collectors' prices for a working tool that has been modified.

Turn the rifle over and look at the action screws. Are the slots clean, or are they chewed up? Mangled slots indicates a rifle that has been taken apart many times – and at least a few of those times with a poorly-fitting screwdriver.

Be sure of the chambering, and be sure it is clearly marked. This Marlin was not a 38-55 when it left the factory; but is now and is clearly so marked.

Remove the bolt if you can. If not, use a reflector or light to illuminate the bore. Is the bore clean and bright? Look at the bore near the muzzle. Do you see jacket fouling or lead deposits? Many an *"inaccurate"* rifle can be made accurate again simply by cleaning the jacket fouling out of the bore. While looking down the bore, hold the barrel so a vertical or horizontal bar in a window reflects down the bore. If the reflection of the bar has a 'break' in it, the barrel is bent. Sight down the outside of the barrel and see if you can spot it. A slightly bent barrel can still be accurate, but will walk its shots when it heats up. A severely bent barrel must be replaced.

Consider rarity when assessing condition. A 30-06 with signs of honest use and hunting wear is a tool. This same rifle, were the barrel marked "300 Savage" or "35 Remington," would be a collector's dream.

SHOTGUNS

Pump-Action & Autoloading Shotguns

Pumps and autoloaders require the same safety check as rifles do, with a few additions. Safety on, pull the trigger, let go, safety off. Dry fire and see if the weight of the trigger pull changes.

When inspecting the barrel, look for dents or creases. Also, inspect the rib (if there is one) to see if it has been dented. While a dented barrel or rib can be repaired so the damage is almost unnoticeable, you can still see evidence of the repair.

Remove the barrel to inspect the bore. Is the bore clean of plastic? Is the choke clean? If not, swab them clean. If there are screw-in chokes, do they unscrew easily and smoothly? While you have the forearm off an autoloader, look at the gas system. Is it clean? Or is it crusty from powder residue? Powder residue can be wiped off, but rust requires more a vigorous remedy, and may leave the shotgun as a non-cycling autoloader.

Double-Barrel Shotguns

Doubles require a different inspection. While looking over the barrels, look to see that the side or bottom ribs are smoothly attached along their length. A lifted rib that has been repaired will have a different appearance at the repair.

Open and close the action. Does the lever move smoothly into place, or do you have to push it the last fraction to fully close it? How far does the lever move? Levers are initially positioned to not go fully to the centerline. As the action wears, the lever moves further and further, taking up the wear. A shotgun with a lever too

far past the centerline may have been shot a great deal, or been taken apart and put back together with the lever mis-timed.

Are screw-in chokes easy to remove? Or do you have to wrestle with them? A bulged choke may mean a ruined barrel. Always unscrew the chokes to make sure they work as intended.

Next, check to see the barrels are tight. Often, the forearm will put enough pressure on the action to make it seem tight. Remove the forearm and then check barrel tightness. Does the barrel assembly move or wobble when closed? Can you see the joint at the action changing size when you try to move the barrel? A loose barrel is an expensive repair, so be sure to check. Pull or twist the barrel in all three axes; attempt to move the rear side to side, lift as

if you were opening the action (but not pushing the lever), and pull the barrels forward. The action should be as tight as a bank vault.

The screw-in chokes in this barrel, while functional, doom the barrel for resale. The wall was cut too thin on one side and chipped out. The owner will never be able to sell the barrel, for who would buy it? You might, if you neglected to check.

Next, the triggers. You'll need snap caps and the owner's permission. Insert the snap caps and close the action. Put the safety on. If the double is a twin trigger, check to make sure the safety blocks both triggers. If it is a single trigger, make sure the safety blocks the trigger when the barrel selector is set to each barrel in turn.

Push the safety to *OFF* and snap one of the barrels. Open the action (*keep your hand over the action to stop the snap cap from being launched across the room*) then close it and select the other barrel. Snap that barrel and open the action again, stopping the snap cap from being ejected. Both barrels work? Good. Close the action, snap one of the barrels, and then slap the butt of the shotgun with

your hand. If the shotgun has a non-inertial trigger – like the Ruger Red Label – you can forego the slapping. Does the second barrel now fire when you pull the trigger? If so, the inertial trigger is working. If not, you may have to slap it harder, or the inertia weight needs adjusting.

HANDGUNS

Handguns come in two types: revolvers and autoloading pistols, and each has sub-types with their own peculiarities. The four types we'll cover are the **single-action revolver** and **double-action revolver**, **single-action autoloading pistol** and **double-action autoloading pistol**.

Single-Action Revolvers

The single-action revolver is known by many as the *cowboy* revolver. Your quick visual inspection of the exterior should start with the sights, to make sure they are straight, and the grips to make sure they are without cracks or dents. Also look at the exterior edge of the muzzle, and the corners of the frame, for signs of dropping. Bent sights and cracked grips indicate a dropped handgun. Dropping can bend the barrel, warp the frame or throw off the timing.

Hold the revolver up to the light, sideways, and look at the cylinder gap. There should be daylight, but not too much of it. The SA comes in the Colt pattern, old Ruger, and the new Ruger.

In Colts and old Rugers, open the loading gate, cock the hammer back to the (*half-cock*) notch that frees the cylinder, and rotate the cylinder. Look to see that it isn't loaded. On new Rugers, opening the loading gate frees the cylinder to rotate. To close up both action "systems," close the loading gate, cock the hammer and, with your thumb on the hammer spur, pull the trigger and ease the hammer forward while holding the trigger back. Check the cylinder for play.

For those who may not know, spinning the cylinder at high speed, or fanning the hammer are both considered abusive handling, and will likely end the sale before it starts. Don't do either!

The wood on this shotgun can be repaired, but what caused it? If a previous owner used magnum shells in a non-magnum-capable gun, the action may be loose. Check the tightness of the barrels to the receiver.

On doubles, check to see if the top lever is easy to move and the action easy to open.

Does the cylinder move back and forth? Called *endshake*, it can be easily fixed, but if there is too much it indicates a revolver that has seen a lot of use. On a Colt-pattern revolver it could mean that the cylinder has been replaced and not properly fitted, or the bushing is worn – or peened – from heavy loads.

Does the top lever go past center? As the locking surfaces wear the lever moves farther and farther. When it reaches the far side of the top strap, it needs to be refitted.

Does it wobble from side to side? The cylinder stop may be worn, or the slots may be worn or too large. Look at the slots. If they have been abused, the edges will be chewed up. If they appear sharp and clean, the cylinder stop may be worn or its spring weak. A worn or abused cylinder is expensive, while a new cylinder stop or spring is relatively cheap.

Slowly cock the revolver, watching the cylinder. Does it come fully into position? Or do you have to push the cylinder around the last fraction of an inch to get it to lock? A cylinder failing to carry up will require a new hand – or require that the old one be "stretched."

Check each chamber. It isn't unusual for a revolver to have one chamber that has a slightly different timing on the *carry up* than the others do. Once you've checked *carry-up*, test the trigger pull. If the owner is leery of letting you dry fire, catch the hammer with your other hand each time you cock it and pull the trigger. Is the pull within normal limits? A heavy pull may indicate someone has fussed with the trigger – as would a very light pull.

***When doubles loosen their ribs and plates, the damage often starts at the muzzle.
Check there first, and then work your way down the barrels.***

While a trigger is relatively cheap, they can be salvaged only sometimes. The hammer is expensive, but you can often have the notch re-stoned (properly, of course) or in extreme cases, welded and re-cut. If the trigger pull has been "messed with," what was done? You can't tell without getting out a screwdriver set and disassembling the revolver there and then. You will have to either take the risk, or insist on a return/refund option if your gunsmith finds something too expensive to fix.

You must remove the forearm before checking a double for tightness. If you don't, the forearm's support may mask any looseness present in the action.

To continue inspecting the Single Action, open the loading gate, release and pull the center pin, roll the freed-up cylinder out of the frame (*to the right*) and inspect the front and rear of the cylinder. On the rear, is the bluing of the ratchet that the hand pushes against evenly worn white? (*A difficult inspection on a stainless or nickel gun, but you can see the wear if you look closely.*) Each chamber should be clean, their edges unmarred. On the front face of the cylinder, check to see if there are marks from the cylinder face rubbing against the rear of the barrel. A cylinder with *endshake* may rub. The rubbing may even be only partial. Don't worry unless the rubbing has been hard or extensive enough to have marred the face of the cylinder.

Hammer clearance on a revolver in single action mode is important. You can see here the hammer may bind on the frame if the spur is bent.

Look at the rear of the barrel. Is the end even and square to the bore? Or has someone been stoning or filing the rear face for some reason? Is the forcing cone clean and smooth?

A revolver that has been fired with lead alloy bullets will often have a forcing cone crusted with lead, even when the rest of the barrel is clean.

A revolver that has seen a lot of jacketed magnum-level loads will show the wear in the forcing cone, the edges of which will be slightly rounded from the heat and abrasion.

Look down the bore. Is it clean and are the lands and grooves smooth and shiny? A pitted bore means the barrel must be replaced. If you see a dark ring (or *donut*) that indicates a "ringed

barrel," the barrel may still be accurate but will probably lead quickly. A bullet stopping partway down the bore, and then being jolted out by the next round fired, causes a "ringed" barrel. The bulge may not show on the outside.

Double-Action Revolvers

The quick exterior inspection should include the hammer spur. Dropping a DA revolver can bend the spur, keeping the hammer from being cocked. Your inspection will reveal this, so be prepared when you get there.

Push the cylinder latch and open the cylinder. Does the latch move smoothly? Does the cylinder move without binding or catching? Check by opening the cylinder at each of its six (or five, seven or eight) positions. A dropped DA revolver can have a bent center pin, and the bend will interfere with opening at only one chamber. On a DA revolver, opening and closing it Hollywood-style, by flicking the wrist, is flagrant handling abuse which will get it snatched out of your hands by many owners.

To check single action engagement, cock the hammer and push the hammer forward with one thumb. Again, ten pounds is all you need.

Check *carry-up*, both in single action and double action modes. You may have to ride your offhand thumb on the hammer as you

slowly do the double-action check, to keep the hammer (and the trigger) from jerking to the end of the DA stroke and thus hiding improper carry-up. If the revolver has been dropped and the hammer spur bent, this is when you'll find out. A bent spur can still work fine in double action, but the hammer goes back farther in cocking for single action. A bent spur may bind against the frame and not allow the revolver to be cocked. With the hammer cocked, put your thumb behind it and give it a gentle push... no more than ten pounds worth. The hammer should stay cocked.

Does the cylinder unlatch smoothly and easily? Binding or requiring force to move is a bad sign, usually indicating a bent crane or bent center pin.

Years ago I had a run-in with a desk sergeant at a local police department about proper testing for push-off (*my home state of*

Michigan requires a safety inspection for the sale of a handgun). He was pushing for all he was worth, with both thumbs, and rejecting every revolver my customers came in with. I finally had to bring in the S&W Armorers Manual, and show him and his supervisor what the factory-accepted test was. If the revolver you are testing pushes off at ten pounds or less, the single-action notch is worn – or has been worked on. Depending on the remedy required, it may be expensive to fix; sometimes requiring a new hammer.

A peened cylinder locking slot indicates heavy use, either many rounds or magnum loads. Peened slots can't be fixed, and require a new cylinder, a major cost.

Check cylinder tightness with the trigger held back, as with the SA revolver, checking for play side-to-side and front-to-back. As on the SA revolver, side-to-side play can be caused by peened locking slots in the cylinder, which is expensive to repair. Or, it can

be caused by a worn cylinder stop (less expensive), or a tired cylinder stop spring (cheap to fix).

Close the cylinder, dry fire and hold the trigger back. Check the cylinder for wobble: front-to-back and side-to-side. Then release the trigger and try again. The cylinder shouldn't move at all when the trigger is held back, and only a little when released.

Endshake is a sign of use with heavy or magnum loads.

Endshake is easy and inexpensive to fix by stretching the crane or installing shims, but both increase cylinder gap at the rear of the barrel. If removing *endshake* increases the gap beyond tolerances, you'll have to have the barrel set back, a moderately expensive fix.

Open the action and look at the front and rear of the cylinder. The front of the cylinder should not show rub marks from the rear of barrel. If it does, it is a sign of excessive *endshake*, which must be fixed. The rear of the chambers should have clean ninety-degree

edges. Some shooters bevel the rear opening of the chambers to make speedloading faster and easier. Properly done, beveling does speed reloads but, improperly done, it can cause improper ejection.

If you see beveling, look closely at the ejector star. Has the star been beveled, too? A proper job bevels the cylinder but not the ejector. A beveled ejector that improperly ejects (the empties will not be fully ejected) is a moderately expensive repair.

Inspect the forcing cone. Is it clean, with sharp edges? A revolver that has seen a lot of magnum loads, especially jacketed ones, will have an eroded forcing cone. A worn forcing cone can cause *spitting* and a loss of accuracy. A worn forcing cone can be fixed, but only by setting the barrel back and cutting a new cone in fresh steel. The gunsmith will also have to shorten the ejector rod and center pin, and will have to remove *endshake* to do the job properly and the cost will be moderate to moderately high.

Look down the bore. Clean, shiny and straight? Good. If it is pitted, or ringed from a bullet having been lodged in the bore, you'll need a new barrel.

The last check concerns the crane. The swing-out crane makes loading and unloading easier, but it is relatively fragile and can be bent by being dropped, or being flipped open Hollywood-style.

Gently close the cylinder, and see how much thumb pressure it takes to lock up. Does the cylinder swing into place and click shut without force? Great. Try it on all chambers, as a bent crane can be offset by other tolerances, and may be hidden on one or more

chambers. If you find you need moderate thumb pressure to get the cylinder to lock in place, the crane may be bent.

The crane on a DA revolver is easily bent from abuse, dropping or incorrect gunsmithing.

A bent crane and its repair are brand-dependent. Rugers are so stoutly built that you need a ball-peen hammer to bend the crane. You also need one to straighten it. A S&W crane is more fragile and more sensitive to misalignment, but a simple job to straighten. The Colt system is less sensitive than the S&W, not as stout as the Ruger, and a more involved job to fix.

Autoloading Pistols, Single-Action

The icon of single-action autoloading pistols is the 1911 pistol. Of all handguns, this one is the most likely to be assembled from parts, played with, experimented upon – and had parts swapped in and out. Any used pistol requires a close inspection to ensure you don't end up with a pig in a poke.

On your exterior visual inspection, don't be put off by parts of different colors. The government never cared about matching the color of Parkerized parts on military-issue 45s, and many shooters through the years have come to favor deliberately two-toned pistols. It is not at all unusual to find a 1911 with a blued slide and nicked or stainless frame, or blued or Parkerized parts on a hard-chromed gun.

A dropped revolver can bend the center pin where it protrudes into the frame. It cannot be straightened and must be replaced.

Check the muzzle end of the slide for dings and gouges indicating it has been dropped. Look at the magazine well. A dropped pistol can crack at the magazine well if the well has been beveled for fast magazine insertion. You may see a crack on the frame forward of the slide stop lever. Pay it no mind. A cracked dustcover on high-mileage auto-pistols is not rare. If you see the crack and the owner says it has never been shot, be suspicious. ***Any crack in a slide is grounds for immediate rejection.*** Cracked slides cannot be repaired, cannot be trusted, and must be replaced.

Give the pistol a brief visual check for signs of dropping, or tool marks from previous experimenting. Work the slide. Does it move smoothly? It should move its full travel without catching, binding or hesitating. A binding slide could be a bent slide, dented frame rails, or a mis-fit replacement barrel. All will be moderately expensive to fix. Or, it could simply be a replacement slide that was not fully lapped to fit – which is cheap to fix.

Some home gunsmithing is beyond the pale. These home-drilled “ports” on this revolver have ruined the barrel. If the seller won’t subtract the cost of a new barrel and installation from the cost, pass it up.

Flip the thumb safety up and down. It should move smoothly and snap from one setting to another. Check the grip safety. It should move in and out without binding, and its spring should snap

it back out when released. A grip safety that doesn't move should set off alarm bells in your head. It was popular in competition circles a decade or more ago to pin down grip safeties so they would not move. A pistol with a pinned grip safety is probably a high-mileage competition gun that has seen tens of thousands of rounds. Even if it has seen only light use, you will have to have the grip safety unpinned and properly tuned.

A revolver with a cylinder that won't fully "carry up" into position behind the barrel is dangerous. If it fires unlocked, the bullet won't be centered in the bore, and will split fragments out through the gap.

Now check the function of the safeties. Happily, owners of the 1911 are much less prone to the "*don't dry fire*" attitude. Check to make sure the pistol isn't loaded, then cycle the slide and dry fire it. Hold the trigger back and work the slide. It should move smoothly. A pistol that is hard to cycle with the trigger held back could have disconnect problems – or an improperly adjusted trigger binding the disconnect. With the slide cycled back and forth, does the hammer stay cocked (*It better, or you will be facing expensive repairs*)? Next, push the thumb safety *ON*. Pull the trigger (using no more than ten pounds pressure), release the trigger and push the safety *OFF*. If the hammer falls, the safety isn't blocking the sear's movement. I've seen pistols that would fire when the safety was *ON* and the trigger was pulled. Not very safe and, potentially, an expensive repair.

The grip safety on the left has been pinned down, and doesn't work. Don't buy a 1911 with a pinned grip safety unless it can be unpinned and tested for function.

If the hammer stays back, you now listen. Lift the pistol to your ear, and gently thumb back the hammer. If you hear nothing (*assuming you have properly worn hearing protection during all those years of shooting*) then the thumb safety is fine. If you hear a little metallic "*tink*" then the safety needs adjustment. If the safety blocks the sear – but not entirely – the sear can move minutely when you pull the trigger. The "*tink*" is the sear tip snapping back into the bottom of the hammer hooks when the spring pressure is released. If the thumb safety passes the "listen" test, you're on to the grip safety.

Does the thumb safety move smoothly, or do you need to force it? Forcing is bad, and indicates a poorly fitted thumb safety.

Once the safety is on, pull the trigger with about 10 pounds of force. Then push the safety off and listen to the sear.

Cock the hammer and hold the pistol so you don't grip the grip safety. Pull the trigger. The test, and "listen," are the same as the thumb safety test, looking for the same problems. Now start looking for signs of abuse or experimentation.

Hold the slide partway back and look at the feed ramp. It should be clean and shiny. There should be a gap between the ramp on the frame and the ramp on the barrel. If someone has polished them to be an uninterrupted surface, they have decreased feeding reliability. An improperly polished or ground ramp is expensive to fix.

Should you check barrel fit? Checking won't tell you much. The customary check is to press down on the chamber area to see if it moves, and having moved, if it springs back. The problem is, it doesn't tell you much. I've seen apparently loose pistols that shot quite accurately, and tight pistols that wouldn't shoot worth a darn.

To check the grip safety's function you have to hold the pistol so you don't depress the safety. Then pull the trigger.

There are some indications that something is amiss. If you are looking at a custom competition gun with a name-brand barrel fitted, and the fit is loose, be suspicious. The barrel may have been simply dropped in (with no attempt at properly fitting it), or it may have been shot tens of thousands of rounds until it wore loose.

If you have a pistol with a plain barrel, tightly fitted, and the front sight is very short, something is up. The barrel may be tight simply because the owner has fitted a long link to the barrel. In which case the link is propping the barrel up to be tight, and the front sight had to be shortened to get the sights to line up with the groups.

To check the disconnect: dry fire, hold the trigger down and slowly cycle the slide.

Lock the slide open and look down the bore. More so than many other pistols, the 1911 can be a high-mileage survivor. Is the bore clean, or fouled with lead or copper? Is the muzzle worn from cleaning? Is there heavy brass "marking" behind the ejection port? Signs of high mileage are not a reason to pass, but if the pistol is offered as "new" or "like new" and you see signs of bore wear, hold on to your money.

On the subject of the cost of repairs to a 1911, the same symptoms can be cheap – or expensive – depending whether the parts involved merely need adjustment, or must be replaced. Accept a dysfunctional 1911 into your home only after careful consideration and acceptance of potentially high repair costs.

Autoloading Pistols, Double-Action

Your visual inspection for the DAs will be the same as with the 1911, except that more of the DAs will have alloy frames. You must take a closer look, especially at a police trade-in, to check for signs of dropping. If you have a pistol with worn bluing, but new grips, look closely. New grips go on only when the old ones are too far gone to be presentable. Police guns get dropped, whacked into car doors and frames, door jambs, light poles, vending machines and seat belt buckles – and that is just when holstered!

Check the frame closely for cracks and signs of dropping, and pass on cracked frames. Glocks get an automatic "passing grade" here, as you can't do more than cosmetic damage, even by throwing one into a cement mixer. Do the dry fire and slide cycle test just as you would with the 1911. Hammerless guns, or DA-only guns, where the hammer follows the slide down, obviously won't show you a cocked hammer to manually manipulate. Dry fire them, cycle the slide, and dry fire again.

The bulge in this barrel remains hidden by the slide when cycled, and can only be seen by removing the barrel from the slide, or carefully looking down the bore.

The safety check is less involved than with the 1911, and is dependent on design. On Glocks, cycle the action and attempt to press the trigger back without depressing the centrally-mounted trigger safety. On DA guns, drop a pencil down the muzzle, eraser end first, and point up.

Push the safety lever to *SAFE*, or use the de-cocking lever. The pencil shouldn't move. Don't pay attention to vibrations. If the safety isn't blocking the firing pin, the pencil will get launched out and upwards.

Buying a used firearm can be rewarding, fun and educational. By taking a few precautions, and using the inspection procedures outlined, you can avoid buying a walnut and blue steel lemon. Have fun and stay safe! *

A pistol should not “smokestack,” or trap the empties in the ejection port, as shown in this simulated malfunction. The cause can be ammo, the pistol – or the shooter. Take the pistol to an independent gunsmith for inspection before returning to the seller, so you know the problem’s source.

Guide to Evaluating Arms Condition

Before a firearm-pricing guide can be effectively used, the condition of the given firearm must be properly evaluated. The following examples provide perspective on establishing a realistic condition assessment of a firearm. MODERN GUN VALUES uses the widely accepted grading criteria developed by the National Rifle Association for modern firearms. For more information, read the Introduction that begins on page 4.

NRA Modern Condition Standards

Here are the NRA guidelines; we have made slight modifications (*italics*) to further help readers determine degrees of condition.

New: In same condition as current factory production, *with original box and accessories*.

Perfect: In new condition in every respect, *but may be lacking box and/or accessories*.

Excellent: Near new condition, used but little, no noticeable marring of wood or metal. Bluing perfect (except at muzzle or

sharp edges).

Very Good: In perfect working condition, no appreciable wear on working surfaces, ***visible finish wear*** but no corrosion or pitting, only minor surface dents or scratches.

Good: In safe working condition, minor wear on working surfaces, no corrosion or pitting that will interfere with proper functioning.

Fair: In safe working condition, but well worn, perhaps requiring replacement of minor parts, or adjustments; no rust, but may have corrosion pits which do not render article unsafe or inoperable.

S&W Highway Patrolman, Model 28

Smith & Wesson Highway Patrolman, Model 28, in 357 Magnum with a 6-inch barrel. Factory target grips exhibit some wear, but no chipping or gouges. Bore and chambers are slick. The exterior shows typical, but modest, wear. NRA VERY GOOD-plus

Colt Police Positive Special

Colt Police Positive Special, 38 Special. This revolver has been buffed and reblued, and a Pachmayr grip-filler added. There is occasional light pitting in the bore and chambers. A collector would pass on this specimen, but the excellent mechanics & reliable function make it a perfectly good utility gun. NRA GOOD

Winchester Model 94 XTR Big Bore

Winchester Model 94 XTR Big Bore, chambered for the 375 Winchester. Used but well-maintained. Only faint wear visible in the usual places on both metal and wood. A slightly modified Lyman receiver sight has been installed; using the factory drilled and tapped mounting holes. The bore is bright and the mechanics are excellent. NRA EXCELLENT

Stevens Favorite No. 26 Crack Shot

Stevens Favorite No. 26 Crack Shot with a 22-inch barrel chambered for the 22LR. Well-used, with obvious wear—but mechanically sound. NRA GOOD

BSA Model 12/15 Match

BSA Model 12/15 Match, a British WWII-era shooting club target rifle chambered for the 22LR rimfire cartridge. There were a number of these, and other Martini-actioned target rifles, imported in the late 1990s and into 2000. This rifle was obviously well used, but maintained. The stock retains about 60 percent of the factory finish, with an old repair – and a ragged hole (*likely from a sling swivel stud that took a bit too much stress*) – at the rear of the forearm. The barrel, receiver and trigger/lever assembly are worn but retain about 80 percent of the original bluing that is thinning in places and turning brown in others. There are no mechanical problems; the reliable Martini action cycles and extracts flawlessly and the trigger breaks cleanly and consistently. The bore is bright, with strong rifling. The Parker-Hale micrometer rear sight is interesting in that the base is drilled through, matching a hole in the receiver that is in alignment with the rifle's bore. Remove the breechblock assembly and the bore can be cleaned from the breech-end, with the sight base serving as the cleaning rod guide. NRA GOOD

Colt Buntline Scout

Colt Frontier Buntline Scout, chambered for the 22LR rimfire cartridge. This model was produced only a dozen or so years, and then discontinued. This particular specimen is mechanically sound, although exhibiting a bit of looseness in the cylinder lockup. Bore and chambers are bright, with no pitting. Bluing on the cylinder and barrel shows distinct holster wear, and the scrapes and scratches accumulated during the 40-odd years since it left the Colt factory. The anodized aluminum frame, trigger guard and backstrap are in good

shape, as are the factory walnut two-piece grips. NRA GOOD-plus

S&W Highway Patrolman, Model 28

Smith & Wesson Highway Patrolman, Model 28. This revolver wears a 6-inch barrel and, like all M28s, is chambered for the 357 Magnum. Bore and chambers are bright, and the mechanical function is excellent. The exterior shows some

holster wear, as well as a few other wear marks. The original factory Magna grips were replaced by a set of Pachmayr rubber grips. NRA VERY GOOD

Winchester Model 70 Deluxe

Winchester Model 70 Deluxe. This is obviously a hunting rifle, with a handy trajectory and wind drift table taped on the left side of the stock. No pitting or corrosion anywhere, and the bore is bright. The bluing is a bit scratched and worn as might be expected on a field rifle and the stock shows field use as well, although in nice overall condition. NRA VERY GOOD

High Standard Sentinel Mark IV

High Standard Sentinel Mark IV, 22WMR with a 2-inch barrel. There is external wear, and the common bolt drag ring around the cylinder. Excellent function. NRA VERY GOOD

Winchester Model 52A

Winchester Model 52A. A nice rifle with most finish remaining on the action and barrel, with few scratches or wear spots. The stock has a few dents and dings, but the factory finish is still

strong & unworn. Bore is bright, and function is excellent.
NRA VERY GOOD-plus

Remington Model 14

Remington Model 14. This particular specimen, fitted with a Williams receiver sight, is chambered for the 30 Remington cartridge and exhibits the wear typical of a well-used but well-maintained hunting rifle. NRA GOOD

Remington Model 11A

Remington Model 11A, in 20-gauge with a Modified choke. The gun has been buffed and reblued. The stock is refinished and shows an amateurish attempt to expand upon the factory wrist checkering. The front sight has been replaced with a white bead. Bore is bright and function is excellent. Not much collector value here, but a good find for a hunter. NRA GOOD

Sturm, Ruger Blackhawk New Model

Sturm, Ruger Blackhawk New Model, 45 Colt, with 7 1/2-inch barrel. The gun has been fired a fair amount, but is well-maintained. The grips are intact and retain the factory finish. The exterior shows light wear only, and the typical bolt drag ring on the cylinder. Excellent function. NRA VERY GOOD-plus

Savage Model 99C

Savage Model 99C. Half-round, half-octagon barrel, chambered for the 303 Savage cartridge. Fitted with a tang sight and combination front sight. This is a well-used rifle with worn stock and metal finish. The action works smoothly and this rifle still has plenty of hunts in it. NRA FAIR

Lefever Nitro Special

Lefever Nitro Special, in 20-gauge with 26-inch barrels. Bores are bright. The frame retains much of the original case-color and the barrels have at least 90 percent of the bluing remaining. The wood shows no cracks, but there are scratches, and a distinct gouge on the forend. All in all, a tight lightly-used specimen with the wear appropriate for its age. NRA VERY GOOD-plus

An Illustrated Guide To Condition

by Joseph Schroeder

To further clarify the standard classifications of “Excellent” through “Fair,” we present the following photographs. Since “New” means just that—new, in the original box with all papers and accessories and perfect means the gun is new but the original box and/or accessories may be missing, we do not show those classifications. All other classifications are subjective, and subject to argument!

Excellent

A Mauser Model 1930, this one about “Very Good.” Note the finish, though almost all there, has dull areas with some light rust “freckling,” and shows more high point wear.

The left side of the “Excellent” Mauser 1930; note the tight fit of the magazine bottom. The Chinese characters translate to “Made In Germany” and add 5 to 10 percent to the value as compared to the same model without markings.

Very Good

A Mauser 1930 "Broomhandle" in "Excellent" condition; the original finish is bright and shiny, showing wear only on the high points, while the grips are clean and sharp with little wear and no dents.

Though the grip grooves are still deep and sharp on this "Very Good" Model 1930, the wood does show the nicks and scratches that come from use.

Excellent

A Colt "Cobra" that rates a solid "Excellent." Its finish is bright and clean with only slight edge wear, and the light original checkering on the grips shows only slight wear on the high spots.

Very Good

A Colt Cobra in “Very Good” condition. The blue, though mostly there, shows more wear and some discoloration. The aftermarket wraparound grips could be considered a plus for some buyers.

Import Markings

Two examples of the import markings now required on all firearms imported into the U.S. The OBI OBNY under the Mauser chamber (right) indicates the importer was Oyster Bay Industries in Oyster Bay, New York. Oyster Bay also marked some Mausers by rolling their marking around the barrel (above). Guns without import markings such as those brought back by GIs bring a premium from collectors.

Good

A Model 1930, this one about "Good." The finish is mostly gone, and there is pitting on the muzzle and around the grips. The grips themselves have some bad scars, with much wear.

The muzzle of the "Good" Mauser; in addition to the deep pitting, the muzzle crown is also worn almost flat.

Fair

A Mauser Model 1930 in “Fair” condition. Not only is there no original finish but there is extensive pitting on the frame, barrel and barrel extension. The push-button on the rear sight latch is missing, and the magazine bottom is a poor fit with a mismatched serial number. The grips are worn almost smooth, and the grip screw is scarred from a slipping screwdriver.

The underside of the “Fair” Mauser; the magazine bottom is a poor fit in the gun, showing an irregular gap between parts. The scratch is from careless use of a screwdriver during removal.

Good

A Colt Cobra that would rate a high "Good." There is a good deal of blue wear with some light rust freckling, and the frame has been drilled just above the hammer for a hammer shroud (missing). The grips are so worn that the original checkering is entirely gone.

The cylinder of the “Good” condition Colt Cobra. Note the fingerprint etched into the cylinder by perspiration and the pits on the adjacent chamber.

Firearms Restoration

by Peter Koppmann

What is firearms restoration – making old guns look new? That definition is close, but not completely accurate. Restoration of anything (cars, boats, paintings, furniture – even airplanes) is the careful re-construction of that particular item to as close to new condition as possible.

The most important factors in any type of restoration project are time, price, and the skill and resources of the restorer. The factor that surprises most people is the cost of a full, high-quality restoration project. High-quality restoration takes a great deal of skill and knowledge; the ability of the restorer to deliver the highest quality restoration possible should be the foremost concern.

Refinishing vs. Restoration

The terms **refinishing** and **restoration** are sometimes used interchangeably, although there is considerable difference between the two. **Refinishing** is just what the name implies, applying a new finish to an existing piece with little or no concern for the underlying surface or internal condition. Think of refinishing as what you do when you repaint a room; you are basically putting a

new finish over the old. **Restoration** is refinishing taken to the highest level.

When restoring firearms, the gun must not only look good but it must be safe to shoot. Any mechanical problems should be corrected before any other work is started. If the mechanical problems cannot be fixed at a reasonable cost, this a good time to decide whether to proceed with the restoration. Once the mechanical issues have been addressed, work on the outside of the gun can begin.

The key to any restoration project is the surface preparation of either the wood or the metal – or both. One of the most overlooked details of modern firearms manufacturing is the fit and finish of the final product. The degree to which most early firearms were finished is one of the reasons they are so desirable. In a restoration project, however, the aspects that generally receive the most attention are the preparation of both the wood and metal surfaces.

Value of Restored Firearms

For whatever reason, firearms restoration has long been looked upon as an undesirable practice. The commonly-held view is that a restored gun is not worth as much as an untouched original gun. That view would be accurate only if you could find an original gun in “as-new condition.” In most cases restoration of a firearm will improve the condition and value of the firearm – providing the restoration is done correctly.

Reasons for Restoration

Restoration offers the shooter the opportunity to own a firearm (often historical) that is as close to factory original as possible. Firearms have played an important role in shaping and protecting this country and certain models are important pieces of history that should be preserved.

In some instances, the costs involved in restoration greatly exceed the value of the finished gun. Remember, the value of the gun is what you would expect to pay for the same gun—if and when you could find it. In some cases the gun may have belonged to a family member—or hold some other sentimental value. A sentimental restoration can return a piece of family history to the current generation or fulfill a desire to own a firearm with particular significance.

These two photos are great examples of “before & after” images of a restoration project to return a Colt Single Action Army to original condition. The original gun (left) was chrome-plated and fitted with a set of plastic imitation stag grips. Notice the gap where the grips meet the frame, and the rounded edges on the cylinder. The completed gun (right) has undergone a complete restoration, including a complete metal polish & new period-correct grips. Notice the crisp lines of the frame and the crisp edges on the cylinder.

Notice the crisp, straight edges on this Colt 1911. This gun has been completely restored and looks just the way it did when it was made in 1917.

Metal Polishing

The degree and direction of polish on metal parts in a restoration is one of the things that differentiate a restored gun from a refinished gun. Remember, a **restoration** is trying to return that firearm to as close to original condition as possible. A **refinished** gun may receive only a minimal amount of metal polishing before the final finishes are applied. In contrast, some restorations may require as many as 40 or 50 hours of polish time to prepare the surface for final finishing. Metal polishing, if done correctly, will

never be noticed; if done incorrectly, however, the deficiency will stick out like a sore thumb.

True metal polishing is a lost art. Most people think of polishing as machine-buffing the part until you can see your reflection. Polishing is not just about making the metal shiny. The order, direction and degree of the polish are just as important as (in most cases, more important than) getting the metal bright and shiny. One of the most critical areas in the polishing sequence is the restoration of the edges. The transition between flat and round surfaces should be sharp and crisp, with the correct direction and degree of polish. The early gunmakers were masters at keeping the edges sharp, crisp and straight.

Another area where the early gunmakers excelled was the polishing of large flat areas leaving few, if any, flaws in the surface. Remember, the surface has to be completely flat, with no ripples or flaws; it's not as easy as it may sound. The skill and talent required to correctly polish these areas cannot be understated.

Stock Work

The marriage of wood to metal is one of the most complex and sometimes frustrating aspects of gunmaking. A restoration may involve only the refinishing of the wood to return it to the correct color. It may also involve the repair of dents, scratches, cracks or splits in the wood. Some restorations may require the complete restocking of the gun, starting with a blank that must be cut and shaped to duplicate the original piece. The type of wood, direction

of the grain and the color of the wood are just a few of the variables in constructing a stock from scratch.

Restocking is the last resort in the restoration of a firearm. If the original wood can be saved it can significantly reduce the cost of the project.

The new stock must be cut and shaped from a block of wood, then married to the action in a process known as inletting. Once the inletting is complete, shaping the stock – an art – to final dimensions can begin.

Once the stock has been shaped, sanded and finished, the process of checkering can begin. Checkering is the cutting of lines into the wood to form small diamonds so the shooter has a textured stock surface to grip. Checking comes in many shapes and styles, from basic to elaborate patterns with carving; in some cases ebony, brass, and gold – even ivory – may be inlaid in and around the checkering. Checkering can add great beauty to the stock as well as being a truly functional part of the gun.

Checkering patterns come in many forms. This Parker A1 Special is an example of a very elaborate checkering pattern that combines standard checkering with woodcarving. This type of work takes a keen eye for detail, and a very steady hand.

Metal Finishing

Metal finishing comes in many different variations. We are all familiar with the bluing on a gun. But did you know that bluing comes in many different varieties and color shades and is specific to certain parts of the gun? For example, Winchester rifles used three different types of bluing on rifle and shotgun barrels throughout the years. The original gunmakers, to harden steel, used color case-hardening. Today we use its vivid colors and unique patterns on the frames of shotguns, rifles and handguns.

This Winchester 1873 features a color case-hardened receiver, one of the most beautiful of the old-time firearm finishes. Due to the varying composition of steel, no two guns ever have the same pattern.

Without going into the specifics of each process, the biggest mistake do-it-yourself gun restorers make is using the wrong finish for a particular firearm. For example, one of the simplest methods of bluing is hot bluing, also referred to as salt bluing. Hot bluing is used by almost every modern gunmaker because it is very easy to do and requires only a small amount of specialized equipment. If you can read a thermometer, you can hot blue! The problem is that hot bluing was not used until the mid-1940s. One of the most common mistakes we see as professional gun restorers is the incorrect use of finishes on vintage firearms. That said, some guns were reblued before they became so highly collectible.

Do-It-Yourself vs. Professional Restoration

Most firearm owners do some form of gunsmithing at some point. One of the most important things to remember about working on your own firearm is to know your limitations and to be

careful. The last thing you want to do is something detrimental to you or the firearm.

This Colt SAA is a current production 3rd Generation gun that has been completely re-worked by Turnbull Restoration to 1st Generation specifications. The gun is chambered in 45 Colt and has a 5 1/2-inch barrel. The 1st Generation conversion includes: enlarging the cylinder flutes, beveling the front of the cylinder, re-knurling the hammer and beveling the front of the ejector housing. The gun has also undergone a complete metal polish to true and crisp all the edges. The frame and hammer are finished with original style bone color case-hardening and the blued parts are finished in traditional Carbona blue. The grips are two-piece amber stag.

aIf you decide to restore your own firearm, pay attention to such details as wood-to-metal fit, direction and degree of the metal polish, barrel and frame markings (these may need to be re-cut or re-applied) and, of course, the correct final finishes. The restoration of a firearm can be a very satisfying and rewarding undertaking, whether you chose to do the work yourself or have it done by a professional. The reasons for restoring firearms vary greatly. Maybe you want to restore your father's old gun, or you just like the look and feel of a classic firearm. Whatever the reason, firearms restoration is a great way to preserve these important pieces of history for future generations. *

Author Peter Koppmann is the shop manager at Turnbull Restorations, which specializes in the refurbishment of American firearms made from 1870 to 1940; to include Colt, Winchester, Marlin, Parker, Fox, L.C. Smith and Ithaca. Specializing in historically-correct metal finishes, including bone color case-hardening, charcoal bluing, rust bluing, nitre bluing and hot bluing, Turnbull Restoration also offers complete metal polishing services and has a complete wood department for restocking and repairs – all under one roof.

Better than Book:

Factors that Add to the Value of a Firearm

By Phillip Peterson

We all know that non-factory alterations can reduce the value of a collectible firearm. Aftermarket chokes, cutdown stocks, recoil pads and other “improvements” may have looked good in their day, but for the most part they leave today’s collectors cold. (How many Winchester Model 12s have you seen with those hideous adjustable chokes hanging off them?)

Recently, however, it was suggested to me that there might also be items or features that could add value to a given firearm. So true.

There are many factors that can be used to arrive at a price for a gun. Some reduce the price, some add to it. In fact, almost any of the factors I just mentioned that can lower the price can add to it as well. It really depends on the intended use for the firearm.

Certainly, if you repair a broken gun to make it usable again, that will add to the value of that gun. It might hurt the value in the eyes of a collector or investor but not the hunter who wants a functional tool to use in the field. The collector probably would not have

wanted that particular firearm anyway. If it was in need of repair it likely was not in good enough condition to appeal to discriminating collectors or investors. Thus it still comes down to the seller and potential buyer agreeing on a price.

Here, there are just a few of the factors that can add to the value of a firearm:

Scopes & Sights

Many add-on accessories and customizations found on firearms are there to make aiming the piece easier and increase the chance of hitting the target. After all, that is the ultimate use for any firearm. So, the holes that are drilled in the receiver of, say, a Winchester Model 75 bolt action .22 to allow the mounting of a scope might not hurt its value at all. In fact, if a hunter wants that model with a scope he will likely be more interested in it. Yes, it is still reduced in value to a collector, but the hunter's cash is just as spendable. Of course, if a "gunsmith" drilled seven off-center holes in the receiver before he got four to match the mounts he had, the gun just looks bad. You can take a good thing too far.

When a rifle or shotgun is offered with a scope already installed, the value of the scope should be included in the overall value of the gun. How much are used scopes worth? I figure current production optics at about one third to one half of retail price when attached to a gun. That way, if the buyer does not want the particular scope they can negotiate a price reduction with the scope removed. Or they can sell it themselves and buy the scope

that suits their needs. Older, out of production scopes have become collectibles in their own right. The long target scopes as made by Unertl, Fecker, Winchester and others can be worth hundreds of dollars. Some firearms manufacturers, such as Marlin and Mossberg, actually used to make their own scopes or had scopes made for them that had their name on it.

Many times I have bought a used Stevens or Mossberg .22 rifle with an old scope on it that is worth more than the gun. I suggest consulting the book *Old Rifle Scopes* by Nick Stroebel when attempting to price older optics. Always check the scope for damage if it is adding to the price of the gun. Make sure the optics are clear, glass lenses have no chips or scratches, crosshairs are intact, and adjusting knobs are working. Getting a broken scope fixed is possible but expensive. Original replacement parts are hard to come by.

In addition to scopes, metallic sights of several configurations will be found. The most popular of these is the tang sight. This is a peep sight that mounts on the tang or back of the receiver of many guns. These were frequently found on Winchester, Sharps, Remington, and other quality sporting rifles. The tang sights made by a gun manufacturer are especially desirable. Winchester-made sights are among the most valuable as collectibles. Other tang sight makers include Marble and Lyman.

Besides tang sights, there are peep sights that mount on the side of a firearm. These were offered by companies like Mossberg, Redfield, Williams, and Lyman. When a firearm is offered that has

an older metallic sight, I refer the reader to the book *Old Gunsights*, also by Nick Stroebel. This fine book lists the metallic sights by maker and model number.

Some of the old aftermarket tang or peep sights required the gun to be drilled and tapped to install the sight. This sort of modification usually reduces the price of a firearm. On the other hand, a Winchester Model 1886 that has had its receiver drilled to install a newer Marbles sight might be worth less to some buyers, but if a period, i.e., vintage, sight is present it could add to the value. Depends on the buyer.

All Scratched Up

Fine engraving on a firearm definitely adds to its value. The amount of coverage can range from a fine highlight on the edges all the way to fully engraved hunting scenes complete with gold inlay. If the work is done by a known engraver, pricing the firearm becomes more akin to pricing a piece of art than a useful tool. As with a fine painting or sculpture, when a known engraver dies, examples of his or her work will skyrocket in price. Some gun makers offered engraving as a special order option on their products. The factory engraved Colts and Winchesters done in the late 1800s by artists such as Nimschke and Ulrich will bring several times their book value. Indeed, many books are devoted solely to this subject.

Engraving done by an amateur or unknown craftsman will be judged solely on its attractiveness on a particular firearm. If you are

contemplating the purchase of an engraved firearm, look closely at the work. Some engraving I have seen was cut too deep and really did not look pleasing. Or there were errors in the pattern that the engraver tried to blend in. After all, an apprentice engraver had to perfect his craft somewhere. The “practice” pieces frequently were sold to buyers who did not spot the defects.

Sometimes the style of engraving may make a gun more (or less) attractive to a given buyer. For example, Germanic-style engraving, with its deep-cut oak-leaf patterns and dramatic portraiture, may turn off some buyers but attract others.

Got Wood?

Walnut was the primary type of wood used to make factory gunstocks in America through the WW II era. The massive production of rifles for military use reduced the stands of available walnut trees and set the industry on a quest to find acceptable substitutes that cost less. In the 1950s, many of the less expensive firearms began being equipped with birch, ash or particle wood stocks. When a model that was once offered with a walnut stock is then sold with a cheaper kind of wood, the older walnut stocked models can bring a higher price. A good example of this is the Ruger 10-22 semi automatic rifle. When introduced in 1964, it sported a walnut stock. In the early 1980s a birch stock replaced the walnut. So a 10-22 with a walnut stock can be worth as much as \$75 more than a recent birch stocked rifle.

The grain structure or pattern in nice walnut stocks can add a lot to the price of a long gun. When walnut stock blanks are sold to gun makers there is a grading system based on the attractiveness of the wood. They use terms like AAA or AA Fancy down to field or utility grade. Very desirable is a striped pattern in the buttstock. This can look like the stripes on a tiger or it might be a pattern of wavy lines of coloration. The finest grade AAA walnut stock blanks can be priced at over \$1000 just for an unshaped wood blank. Imagine how much that finished stock would add to the value of a pre 1964 Winchester Model 70. It could quickly make that \$750 rifle in to a \$4500 rifle.

I have seen many mid-grade stocks on field-grade shotguns and rifles. Mid-grade walnut might have some tiger stripe pattern near the butt end but standard grain in the rest. These are fairly common so they don't attract the high rollers who want the AAA fancy wood. There is no set way to calculate the additional value in stock appearance. It is a very subjective thing, attractiveness of a piece of wood. But it can add to the price of a gun for someone who likes it.

Any discussion of stock materials must also consider synthetics. Some synthetics can add significantly to the value of a gun. A Remington Nylon 66 .22 rifle with Seneca Green stock can bring twice as much as an otherwise identical model in Mohawk Brown.

Get a Grip

Grip materials can also add to the value of a handgun. A S&W First Model .32 Hand Ejector with factory pearl grips can bring 50 percent more than an otherwise identical gun with hard rubber grips. In fact, in some cases factory pearls are worth more than the gun itself! None-factory aftermarket grips, no matter how nice, do not generally add to the value of a gun. Quite the contrary.

Previous Ownership

Previous ownership of a gun can also add significantly to its value. One of John Wayne's Great Western revolvers, for example, can bring many times as much as a similar model owned by Joe Blow. But such enhanced value depends on the celebrity status of the previous owner. A Colt SAA owned by Mel Torme might not be particularly attractive to a younger buyer ("Mel *Who?*").

Note that previous ownership of a gun always depends on provenance, i.e., the paper trail that proves such ownership. Without provenance, claims of previous ownership are merely talk, and worth about just as much.

Potential Historical Association

Sometimes a gun is worth more merely because it was produced during a historically-relevant era. A Colt SAA whose serial number places it in the range of those used by the U.S. Army at the Battle of Little Big Horn, for example, is automatically more valuable than one outside that range. It doesn't matter if it can't be proven that the gun in question was carried during the battle—

although that would be nice. The mere fact that it *might* have been significantly adds to its value.

Wrapping It Up

Another item that will add to the price of an older gun is the original box and paperwork that came with a gun when sold new. On vintage Colts or Smith & Wessons a box and papers could almost double the price of the gun. Of course, the Commemorative guns as made by Colt and Winchester in the 1960s and 70s have to be unfired and have their boxes and literature to be worth full book price. Even utility grade firearms sold as recently as five or 10 years ago can be enhanced by having the box with them.

Finally, there are any number of add-on accessories that might come with a used gun that can add to the value for a prospective buyer: Slings, holsters, extra magazines, boxes of ammunition or brass, scope covers, bi-pods, cases, or any other accessory that was purchased and installed by the owner. All of these cost money. I frequently buy guns, then the owner brings in another \$50 or 100 worth of stuff and says “here, these were with that gun.” Every little bit helps.

When acquiring or selling firearms, it pays to remember that not everyone wants a museum-quality collectible. Some want hunting guns, some want shooters. Some want guns from a specific period in history. Any factor that caters to any of these interests can add to the value of a gun – sometimes a little, sometimes a lot. *

COLT BISLEY

Colt Bisley

Revolver; single action; 455 Eley, 45, 44-40, 41, 38-40, 32-20; with trigger, hammer and grips redesigned for target shooting. Target model features target sights, flat-top frame. Bisley version of Colt SAA revolver first offered in flat-top target version in 1896 for use in target matches held at Bisley Common in England. The revolver's good performance encouraged Colt to offer it both in target and

standard sighted versions until 1912. Bisley version featured a longer, more angled grip frame that placed the hand at almost a 90-degree angle to the bore. Parts, except for triggerguard, backstrap, grips, mainspring, hammer, and trigger, are totally interchangeable with standard Colt SAA. Standard calibers, barrel lengths, and finishes same as 1st Generation Colt SAA. Manufactured from 1894 to 1913.

COLT NEW FRONTIER

Colt New Frontier

Revolver; flat-top target version of Colt Single Action Army first introduced in 1962 during 2nd Generation production and continued until 1974. Serial numbers began at 3000NF and ended in 1974 with 7288NF. Calibers offered during 2nd Generation were 45 Colt, 44 Spl., 357 Mag., and 38 Spl. Standard barrel lengths 4-3/4-inch, 5-1/2-inch, 7-1/2-inch; a total of seventy-two 45 Colt Buntline New Frontiers manufactured with 12-inch barrels. Finish was Colt's royal blue with color case-hardened frame. Two-piece walnut grips were standard. Manufacture of New Frontiers resumed in 1978 during 3rd Generation production and continued until 1985. Serial numbers began again at 01001NF and ran to approximately 17000NF by 1985. During 3rd Generation production, calibers offered were 45 Colt, 44 Spl., and 357 Mag., with 44-40 being added in 1981. Finishes were Colt's royal blue with color case-hardened frame, with fully nickel-plated, and fully-blued being rarely-found options. Barrel lengths were the standard 4-3/4-inch, 5-1/2-inch, and 7-1/2-inch.

COLT SINGLE ACTION ARMY

Colt Single Action Army (1st Generation)

Colt Single Action Army (2nd Generation)

Colt Single Action Army also known as Peacemaker, or Frontier Six Shooter (44-40 caliber only). Originally introduced in 1873 and produced continuously until 1941. This production is run known as “1st Generation.” The production run resumed in 1956 and stopped again in 1974 is known as “2nd Generation.” Production known as “3rd Generation” began in 1976 and is still being manufactured. 1st Generation serial numbers began in 1873 with #1 and ended in 1941 with serial number 357859. The first Generation production included two frame styles: From 1873 until 1892, frames had screw angling in from front of frame to secure cylinder base pin; starting in 1892, and becoming standard by 1896, cylinder pin is secured by spring-loaded transverse catch. These frames are mistakenly called “blackpowder”

and “smokeless powder” frames respectively, but it should be noted that Colt did not warranty any SAA revolvers for smokeless powder until 1900 at about serial number 192000. Rarer calibers and barrel lengths bring considerable premium over prices shown.

When 2nd Generation production began in 1956, serial numbers started at #0001SA, and continued until approximately #74000SA. 3rd Generation production started in 1976 and serial numbers resumed at #80000SA. When #99999SA was reached in 1978, the SA was made a prefix and numbers started once more at #SA00001. When #SA99999 was reached about 1993, the SA was split and numbers started once more at #S0001A. Standard barrel lengths for all three generations have been 4-3/4-inch (introduced 1879), 5-1/2-inch (introduced 1875), and 7-1/2-inch (introductory length offered in 1873). During 1st Generation production, any barrel length could be special ordered. Examples are known ranging from 2-1/2-inch to 16-inch. During 2nd and 3rd Generation production, special runs were made as Sheriff’s Model with 3-inch barrels and no ejector rod housings. During 2nd and 3rd Generation, Buntline Special versions with 12-inch barrels were cataloged. A 3rd Generation Storekeeper’s Model was also cataloged with 4-inch barrel and no ejector rod housing.

Standard finishes for all three generations have been color case-hardened frame with remainder blued, or fully nickel-plated. Some fully-blued SAAs have been offered by Colt from time to time. For 1st Generation, standard grips were one-piece walnut in early production and two-piece hard rubber in later production. Standard grips in 2nd Generation were hard rubber, and both hard rubber and two-piece walnut in 3rd Generation. Standard sights were groove

down revolver's topstrap and blade front. However, a rare flattop target model was also offered during 1st Generation run. Caliber options for 1st Generation revolvers numbered approximately thirty, ranging from 22 rimfire to 476 Eley. However, the top five in terms of numbers produced were 45 Colt, 44-40, 38-40, 32-20 and 41 Colt. 2nd Generation calibers in order of numbers produced were 45 Colt, 357 Magnum, 38 Special, 44 Spl. 3rd Generation calibers started in 1976 with 45 Colt and 357 Mag. In 1978, 44 Spl. was added, and in 1980 44-40 was included once more. In 1993, 38-40 was made an option again. 2nd Generation Buntline and Sheriff's Models made only in 45 Colt from 1957 until 1974. 3rd Generation Buntline and Sheriff's Models made in 45 Colt, 44-40, and 44 Spl. calibers from 1980 until 1985. So-called "blackpowder frame" model with screw angling in from front of frame to secure cylinder base pin re-introduced in 1984 and offered as custom feature until early 1990s. During period 1984 to 1994, Colt SAAs could be ordered from Colt Custom Shop with almost any combination of features listed above.

LUGER MODEL 1906 NAVY

Luger 1906 Navy

Semi-automatic; 9mm Para.; 6-inch barrel; flat checkered toggle knobs; exposed breechblock with extractor that protrudes when chamber is loaded and exposes German word "GELADEN" (LOADED); adjustable rear sight on rear toggle link; coil instead of leaf recoil spring; grip safety; stock lug on rear of frame. Usually called "Model 1906 Navy" by collectors but was officially designated Model 1904 by the German navy. Note: Original 1904 Navies that have a toggle lock cut into right toggle knob like Model 1900 are very rare and valuable but beware of fakes.

With original 20-shot stock holster

Exc: \$40,000	VGood: \$25,000	Good: \$20,000
----------------------	------------------------	-----------------------

MAUSER MODEL 1896 “FLATSIDE”

Mauser Model 1896 “Flatside”

Semi-automatic; 7.63mm Mauser; 10-shot magazine; 5-1/2-inch barrel; 11-1/2-inch overall length; flat frame sides; narrow trigger; large ring hammer; tangent rear sight; locked breech action; grooved wood or (rarely) hard rubber grips; blued finish. The 6-shot flatsides are very rare and very valuable.

Exc: \$2000	VGood: \$1500	Good: \$1000
--------------------	----------------------	---------------------

MAUSER MODEL 1899 “FLATSIDE” ITALIAN NAVY

Semi-automatic; 7.63mm Mauser; 10-shot magazine; 5-1/2-inch barrel; 11-1/2-inch overall length; flat frame sides; narrow trigger; large ring hammer; tangent rear sight; locked breech action; grooved wood grips; blued finish. 5,000 flatsides made for Italian navy and distinguished by small “DV” on chamber side and crown over “AV” under barrel; serial numbered 1 to 5000.

Exc: \$2500	VGood: \$2000	Good: \$1000
--------------------	----------------------	---------------------

MAUSER MODEL 1896 LARGE RING HAMMER

Semi-automatic; 7.63mm Mauser; 10-shot magazine; 5-1/2-inch barrel; 11-1/2-inch overall length; paneled frame sides like the Conehammer; narrow trigger; large ring hammer; tangent rear sight;

locked breech action; grooved wood or (rarely) hard rubber grips; blued finish.

Exc: \$1750	VGood: \$1350	Good: \$950
--------------------	----------------------	--------------------

MAUSER MODEL 1896 PRE-WAR BOLO

Mauser Model 1896 "Pre-War" Bolo

Semi-automatic; 7.63mm Mauser; 10-shot magazine; 3-15/16-inch barrel; 10-inch overall length; paneled frame sides; narrow trigger; large or small ring hammer; tangent rear sight; locked breech action; small grip frame with wood or hard rubber grips; blued finish.

Exc: \$2250	VGood: \$1500	Good: \$950
--------------------	----------------------	--------------------

With original Bolo (short) stock-holster

Exc: \$3500	VGood: \$2750	Good: \$1750
--------------------	----------------------	---------------------

MAUSER MODEL 1896 6-SHOT

Mauser Model 1896 6-Shot (fixed rear sight)

Semi-automatic; 7.63mm Mauser; 6-shot magazine; 3-15/16-inch barrel; large or small-ring hammer; fixed or tangent rear sight.

Exc: \$4500	VGood: \$3500	Good: \$2000
--------------------	----------------------	---------------------

MAUSER MODEL 1896 PRE-WAR COMMERCIAL

Semi-automatic; 7.63mm Mauser; 10-shot magazine; 5-1/2-inch barrel; 11-1/2-inch overall length; paneled frame sides like the Conehammer; narrow trigger; small ring hammer; tangent rear sight; locked breech action; grooved wood or (rarely) hard rubber grips; blued finish. Made 1905-1918. Higher serial numbered examples usually have German military proofs.

Exc: \$1000	VGood: \$850	Good: \$500
--------------------	---------------------	--------------------

Exc: \$2750	VGood: \$2000	Good: \$1500
--------------------	----------------------	---------------------

MAUSER MODEL 1896 9MM EXPORT

Semi-automatic; 9mm Mauser; 10-shot magazine; 5-1/2-inch barrel; 11 1/2-inch overall length; paneled frame sides like the Conehammer; narrow trigger; small ring hammer; tangent rear sight; locked breech action; grooved wood or (rarely) hard rubber grips; blued finish.

Exc: \$1750	VGood: \$1250	Good: \$950
--------------------	----------------------	--------------------

MAUSER MODEL 1896 CARBINE

Semi-automatic; 7.63mm; 10-shot; 11 3/4-inch, 16-inch barrel; take-down sporting carbine made on Mauser pistol action. Made in limited numbers from 1896 to about 1906 with paneled or smooth sides and with all three hammer styles. Very high collector value. Note: Very early cone-hammer and a few very late carbines chambered for 9mm Para. or 9mm Export bring a premium.

Exc: \$15,000	VGood: \$12,500	Good: \$9000
----------------------	------------------------	---------------------

MAUSER MODEL 1916 “RED 9”

Semi-automatic; 9mm Para.; 10-shot; 5-1/2-inch barrel. Made under contract for the German army. Called by collectors “Red 9” because most (but not all) have large figure “9” cut into the wood grips and painted red to distinguish them from 7.63mm pistols also in use by army.

Exc: \$1350	VGood: \$750	Good: \$650
--------------------	---------------------	--------------------

MAUSER MODEL 1896 WEIMAR REWORK

Many WWI Red 9 military pistols were reworked 1920-1921 to conform with the Treaty of Versailles by cutting barrels to 4-inch, replacing tangent sight with fixed rear sight. Usually identified by “1920” stamped on side.

Exc: \$850	VGood: \$600	Good: \$500
-------------------	---------------------	--------------------

With Weimar navy markings

Exc: \$1250	VGood: \$900	Good: \$750
--------------------	---------------------	--------------------

MAUSER MODEL 1896 “FRENCH GENDARME”

Mauser Model 1896 “French Gendarme”

Semi-automatic; 7.63mm; 10-shot magazine; supposedly made for French occupation forces with 3-15/16-inch Bolo barrel but full-size grip frame; checkered hard rubber grips.

Exc: \$1000	VGood: \$850	Good: \$600
--------------------	---------------------	--------------------

MAUSER MODEL 1896 POSTWAR BOLO

Mauser Model 1896 Postwar Bolo

Semi-automatic; 7.63mm; 10-shot; 3-15/16-inch barrel; small grip frame with grooved wood grips. Made about 1920 through 1930.

Exc: \$950	VGood: \$700	Good: \$450
-------------------	---------------------	--------------------

MAUSER MODEL 1930

Mauser Model 1930

Semi-automatic; 7.63mm; 10-shot; 5-1/4-inch barrel (early), 5-1/2-inch barrel. Slightly updated version of Model 1896 distinguished by small step in barrel, wide grip straps with 12-groove wood grips, high polish bright acid blue finish instead of duller rust blue. Note: A few 1930-type Mausers were made with detachable 10- or 20-shot

magazines and are very rare and valuable. Beware of fakes made by welding up switch holes of a Model 1932.

Exc: \$1500	VGood: \$1250	Good: \$500
--------------------	----------------------	--------------------

With proper stock-holster with Mauser banner, no serial number

Exc: \$2000	VGood: \$1500	Good: \$1100
--------------------	----------------------	---------------------

Warning: Model 1932 (also called Model 712) pistols have a selector switch for full-auto fire as well as detachable magazine. They are illegal to own unless registered with the BATF.

MAUSER CHINESE COPIES OF THE MODEL 1896

TAKU NAVAL DOCKYARD

Semi-automatic; 7.63mm; 10-shot; 5-1/2-inch barrel; flat frame panel sides; large ring hammer; grooved wood grips. Marked "TAKU NAVAL DOCKYARD" on top of chamber.

Exc: \$1250	VGood: \$850	Good: \$500

SIGARMS P250 COMPACT

SIGARMS P250 Compact

Introduced in 2008. A 9mm semiauto pistol of so-called “modular design” that enables the shooter to quickly remove the functional mechanism and place it into the polymer grip of his choice. This allows an immediate change in caliber and size;(subcompact, compact and full). And after any change the pistol delivers both outstanding accuracy and reliable functionality. Its modularity not only provides incredible ease of maintenance, but also provides a solution for accommodating different hand sizes - there are 6 different ergonomic combinations for each size, accomplished by

changes in grip circumference and trigger style. Matte or duotone finish.

New: \$650	Exc: \$550	Exc: \$450
-------------------	-------------------	-------------------

SIG SAUER P290

SMITH & WESSON 38 MILITARY & POLICE

Revolver; double action; 38 Spl.; 6-shot; 4-inch, 5-inch, 6-inch, 6-1/2-inch barrels; hard rubber round butt (early models) or checkered walnut square-butt grips; blue or nickel finish. The first S&W K-frame was the 38 Hand Ejector which later became known as the 38 Military & Police. This model was introduced in 1899 and has been in continuous production. During the last 96 years, S&W has produced over 5 million of these revolvers, resulting in numerous variations which affect values only slightly. The most collectable of these, the 38 Hand Ejector First Model, can be easily recognized by the lack of a locking lug located on the underside of the barrel and the serial number 1 through 20,975. Between 1899 and 1940 this model was available with both fixed sights and an adjustable target sight. The target model, referred to as the 38 Military and Police Target Model, brings a premium price and was the predecessor to all K-frame target models.

SMITH & WESSON 38 MILITARY & POLICE VICTORY MODEL

Revolver; 38 Spl., 38 S&W; 2-inch, 4-inch, 5-inch barrels; smooth walnut grips; midnight black finish. The Victory Model is the WWII production variation of the 38 Military & Police Model. Its name was derived from the serial number prefix “V,” a symbol for “Victory.” The revolvers provided the U.S. government were in 38 Special; those provided to the U.S. Allied Forces in 38 S&W. At the end of WWII the “V” serial number prefix was changed to “S,” which was continued to 1948 when the series again reached 1,000,000. Add 50 percent for U.S. military markings (beware of fakes!).

SMITH & WESSON MODEL 10 MILITARY & POLICE

Smith & Wesson Model 10 Military & Police

Smith & Wesson Model 10 Military & Police (1995 model)

Revolver; double action; 38 Spl.; 6-shot; 2-inch, 3-inch, 4-inch, 5-inch, 6-1/2-inch barrel; 11-1/8-inch overall length with square butt, 1/4-inch less for round butt; weighs 31 oz.; 1/10-inch service-type front sight and square notch non-adjustable rear; square-butt checkered walnut stocks, round butt pattern with choice of hard rubber or checkered walnut; blued or nickel finish. In 1957 a 4-inch heavy barrel became available and is the 4-inch barrel configuration still available. The 38 M&P has been the true workhorse of the Smith & Wesson line of revolvers. The basic frame is termed S&W's K-frame,

the derivative source of the K-38, et al. It is, quite possibly, the most popular, widely accepted police duty revolver ever made. Introduced about 1902. Reintroduced 1995.

SMITH & WESSON MODEL 15 38 COMBAT MASTERPIECE

Smith & Wesson Model 15 38 Combat Masterpiece

Revolver; double action; 38 Spl.; 6-shot; 2-inch, 4-inch, 6-inch, 8-3/8-inch barrel; 9-1/8-inch overall length; weighs 34 oz.; blue or nickel finish. It took some years after WWII to re-establish commercial production and begin catching up with civilian demands at S&W. By the early '50s the situation was bright enough to warrant introducing a 4-inch version of the K-38, which was designated the 38 Combat Masterpiece. Its only nominal companion was the 22 Combat Masterpiece and no attempt was made to match loaded weights, as in the K-series-the 38 weighing 34 oz. empty, compared to 36-1/2 oz. for the 22 version. Barrel ribs were narrower than the K-series and front sights were of the Baughman, quick-draw ramp pattern,

replacing the vertical surface of the K-series Patridge-type. No longer in production.

SMITH & WESSON MODEL 17 K-22 MASTERPIECE

Smith & Wesson Model 17 K-22 Masterpiece

Revolver; double action; 22 LR; 6-shot; 6-inch barrel standard, 8-3/8-inch available; 11-1/8-inch overall length (6-inch barrel); weighs 38-1/2 oz. (6-inch), 42-1/2 oz. (8-3/8-inch) loaded; blue finish.

Redesigned version of Model 16. Postwar production added the refinement of a broad barrel rib, intended to compensate for weight variations between the three Masterpiece models. Likewise added were the redesigned hammer with its broad spur and thumb tip relief notch, an adjustable anti-backlash stop for the trigger and the Magna-type grips developed in the mid-'30s to help cushion the recoil of the 357 Magnum. Introduced around 1947; dropped 1998.

SMITH & WESSON MODEL 53

Smith & Wesson Model 53 (22 Magnum)

Revolver; double action; 22 Jet; 6-shot; 4-inch, 6-inch, 8-3/8-inch barrel; 11-1/4-inch overall length (6-inch barrel); weighs 40 oz.; 1/8-inch Baughman ramp front, adjustable S&W micrometer-click rear; checkered walnut grips with S&W medallion; blued finish only.

Starting in the late '50s, there was considerable interest in converting K-22s to centerfire wildcat (i.e., nonstandard cartridge) configurations usually being chambered for a shortened version of the 22 Hornet, known as the 22 Harvey K-Chuck. With the intent of capitalizing on this interest, S&W introduced the 22 Remington CFM or centerfire magnum cartridge – also termed the 22 Jet – and the Model 53 chambered for it. The 22 Jet was a necked-down 357 case, designed to use a bullet of .222-inch to .223-inch diameter.

The Model 53 was supplied with six chamber bushings, adapting it for firing 22 rimfire ammo, by means of repositioning the striker on the hammer. Alternatively, a standard 22 LR cylinder was offered as a factory-fitted accessory at about \$35.30 for interchanging with the 22 Jet cylinder. Introduced 1960; dropped 1974.

SMITH & WESSON MILITARY MODEL OF 1917

Smith & Wesson Military Model of 1917

Revolver; 45 ACP, 45 Auto Rim. Entry of the U.S. into WWI found facilities unable to produce sufficient quantities of the recently adopted Colt Government Model auto pistol, so approximately 175,000 Smith & Wesson revolvers were manufactured, being chambered to fire the 45 ACP cartridge by means of the two 3-shot steel clips; also fires the 45 Auto Rim round. The wartime units had a duller blued finish and smooth walnut grips, with 5-1/2-inch barrel; overall length, 10-1/4-inch; weighs 36-1/4 oz. with lanyard ring in the

butt. A commercial version remained in production after the end of WWI to the start of WWII, distinguished by a bright blue finish and checkered walnut stocks.

STURM RUGER P89D DECOCKER

Similar to the standard P89 except has ambidextrous decocking levers in place of the regular slide-mounted safety. The decocking levers move the firing pin inside the slide where the hammer can not reach it, while simultaneously blocking the firing pin from forward movement-allows shooter to decock a cocked pistol without manipulating the trigger. Conventional thumb decocking procedures are therefore unnecessary. Blue or stainless steel. Introduced 1990.

FRANCOTTE, AUGUSTE

Francotte rifles are custom made to the customer's specifications. Because of the individuality of rifles encountered used, values will fluctuate greatly within models. Options such as engraving, inlays, sights, wood and caliber will determine each rifle's worth. An individual expert appraisal is recommended. Priced new from \$15,000 to \$40,000. Used values range from 50 percent to 75 percent of new pricing.

FRANCOTTE BOXLOCK DOUBLE

Side-by-side; 243, 270, 30-06, 7×64, 7×65R, 8×57JRS, 9.3×74R, 375 H&H, 470 N.E.; 23-1/2-inch-26-inch barrel lengths; bead front sight on ramp, quarter-rib with fixed V rear; primarily custom-built gun; oil-finished European walnut stock; checkered butt; double triggers; manual safety; floating firing pins; gas-vent safety screws; coin finish or color case-hardening; English scroll engraving; numerous options. Made in Belgium. Still imported by Armes de Chasse.

FRANCOTTE CARPATHE MOUNTAIN
